Agenda

- Different attacks, different sources
- Applying IP Intelligence – determining what, how and why
- Your IP Intelligence toolbox
- Summary

Data At Risk

297,722,969

Total publicly stolen data records by external hackers in the US since 2005.

The Rise of Industrialized Hacking

Roles

Researching Vulnerabilities
Developing Exploits
Growing Botnets
Exploiting Targets
Consuming

Optimization

Direct Value – i.e. IP, PII,
CCN
Command & Control
Malware Distribution
Phishing & spam
DDoS
Blackhat SEO

Automation

Growing Botnets and
Exploiting Vulnerabilities
Selecting Targets via Search
Engines
Templates & Kits
Centralized Management
Service Model

It's Not Going to Stop

\$1 TRILLION

The amount of money rolled in the hacking industry.

Source:

Joseph Menn, **Fatal System Error: The Hunt for the New Crime Lords Who Are Bringing Down the Internet**, January 2010

More Hacking Motivations - Competitors

■ Data theft

- ▶ Intellectual property
- ▶ Company secrets
- ▶ Business plans

■ Blackmail

- ▶ Employee details
- ▶ Company tradings
- ▶ DoS

■ Corporate espionage

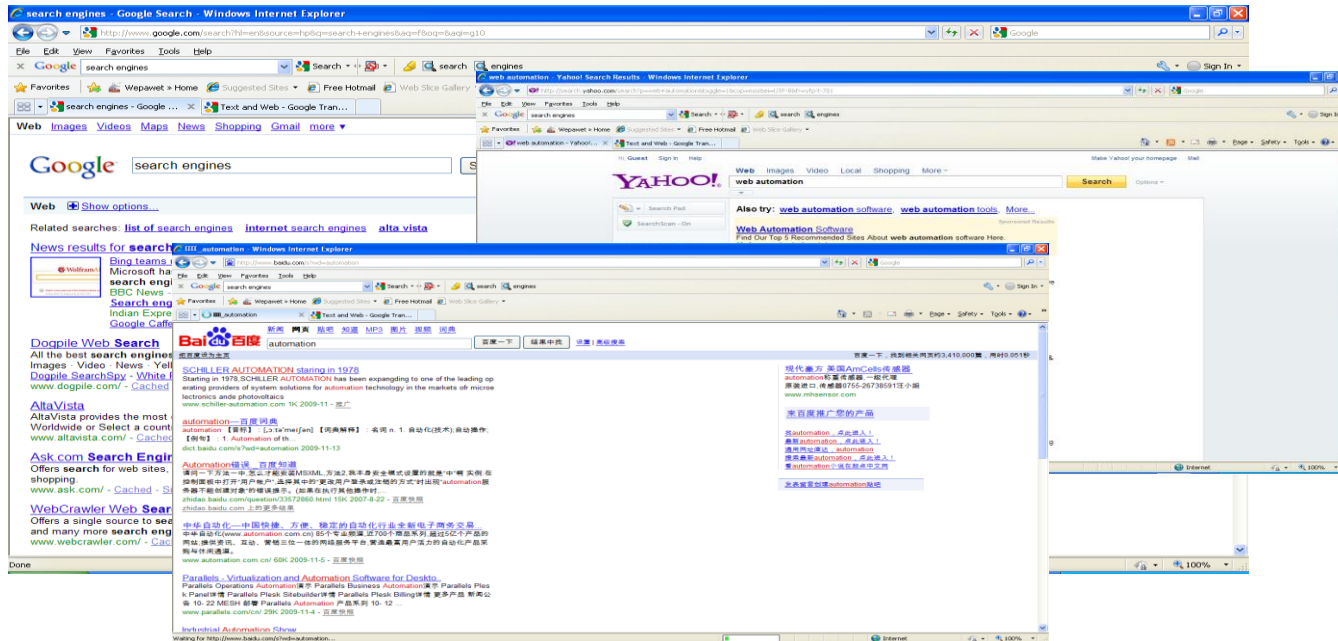

More Hacking Motivation – Nation States

- Advanced Persistent Threats (APT)
 - ▶ Politically motivated
 - ▶ Cyber-warfare
 - ▶ Government espionage
- When Hactivism Meets Industrialization
 - ▶ Stuxnet?!

Different Hack Sources – Common Ground

- Formalized Attack Tools
- Formalized Attack Services
- Automation

The Security Solution

- Quickly prevent the “Known Bad”
- Focus analysis on the “Unknown Bad”
 - ▶ Mixture of sources
 - ▶ Different threat levels
 - ▶ Varied sophistication

IP Addresses - First Impression (1)

■ Connection Aggregators

- ▶ Large organizations, ISPs
- ▶ A single IP represents a group of unrelated sources

IP Addresses - First Impression (2)

■ Masquerading

- ▶ Proxies, relays, TOR
- ▶ The IP address does not represent the true source

IP Addresses - First Impression (3)

■ Hopping

- ▶ Dynamic allocation
- ▶ Attacker can alternate between addresses during a single session

IP Addresses – On a Second Look (1)

- Persistent connections for home users (Cable, DSL)
 - ▶ 65% of dynamically allocated addresses persist for more than a day
 - ▶ 15% for more than a week

Source:

<http://research.microsoft.com/pubs/63680/sigcomm07-onefile.pdf>

IP Addresses – On a Second Look (2)

- Many attacks do not go through aggregators (i.e. home users)
 - ▶ IPv4 is still not exhausted
 - <15% of available IPv4 addresses were used in Q3 2009 (Akamai)
 - Only 60% of available addresses are allocated with a growth rate of 11% per year (IP2Location)
- Not all hopping activity matters
 - ▶ Usually within the same country or area
- IPv6?

Introducing IP Intelligence

- What IP Intelligence is:
 - ▶ **Gather information** – obtain enough information about individual IP addresses
 - ▶ **Analyze retrieved information** – analyze what can be used to assist in security decisions and influence them
 - ▶ **Apply Intelligently** - apply the information in automated decision engines or manual forensic analysis

Gathering IP Information

■ Inherent Information

- ▶ Type of allocation (Dynamic/ Static)
- ▶ Ownership (ISP/ Individual)
- ▶ Geo Location

■ Reputation-based

- ▶ Known infections
- ▶ Reported nefarious behavior

Aspects of IP Intelligence

Geo Location

Thwarting masquerading

Connection
and
Allocation
Attributes

Reputation

WHAT? WHY? HOW?

Geo Location - What

- Assign a physical geographical location to a network address
- Different levels of granularity
 - ▶ Country (usually reliable)
 - ▶ City ("Greater Area")
 - ▶ POP

Geo Location – How (1)

- Explicit Registrar Information
- Network Analysis
 - ▶ Route
 - ▶ Timing

Geo Location – How (2)

■ Degree of Accuracy

| Geography | Your IP Information |
|-----------------------|-------------------------------|
| Continent: | asia |
| Country: | il |
| Country CE: | 99 |
| Region: | |
| State: | hamerkaz |
| State CE: | 99 |
| City: | petach tikva |
| City CE: | 80 |
| DMA: | |
| MSA: | |
| Carrier: | 012 smile communications ltd. |
| ASN: | 9116 |
| Connection Type: | cable |
| Connection Speed: | medium |
| Special Routing Type: | yes |

| | |
|--------------------|-------------------|
| Your IP Address | [REDACTED] |
| Countries | Israel |
| Region | 02 (Hamerkaz) |
| US Area Code | |
| US Metro Code | |
| Global Cities | Ashdod |
| US Zipcode* | |
| Latitude/Longitude | 31.8167/34.6500 |
| ISP | Golden Unes Cable |
| Organization | Golden Unes Cable |
| Netspeed | Cable/DSL |
| Domain Name | 012.net.il |

| Live Demo Using IP2Location™ - February 2010 | |
|--|-----------------------------------|
| IP Address | [REDACTED] |
| Location | ISRAEL, TEL AVIV, TEL AVIV |
| Latitude / Longitude | 32.067 LATITUDE, 34.787 LONGITUDE |
| Connecting through | A1MFRVA-LTD |
| Time Zone | UTC +02:00 |
| Net Speed | COMP |
| IDD Code | 972 |
| Weather Station | ISRX0026 - TEL AVIV-YAFO |

Geo Location – Why (1)

■ Business Logic Attacks

- ▶ Unexpected geographic locations
- ▶ Functionality limitations
 - EU regulations restrict access of personal information from outside the EU

Geo Location – Why (2)

■ Fraud Detection

- ▶ Unusual geographic locations
- ▶ Simultaneous access from different locations
- ▶ Account differences
 - Physical location
 - Shipping
 - Billing

Geo Location – Why (3)

■ Analyze distributed attacks

- ▶ Manually or automatically
- ▶ Examples:
 - Scalping Attack
 - Comment Spam

Geo Location – Why (4)

■ Influence Fuzzy Decisions

- ▶ Flag as: suspicious, malicious or benign

■ May require further investigation

- ▶ Adaptive authentication
- ▶ Reduced functionality

Connection and Allocation - What

■ Allocation

- ▶ Dynamic
- ▶ Static

■ Connection

- ▶ Dial-up
- ▶ Cable
- ▶ T1

■ Speed

Connection and Allocation - How

■ Network Analysis

- ▶ Route
- ▶ Timing

Connection and Allocation – Why

- Dynamic allocations are usually not servers
 - ▶ According to Microsoft the vast majority (96%) of SMTP traffic originating from dynamically allocated addresses is spam.
- Dynamic allocations are usually not aggregators
 - ▶ Easier to detect brute force attacks
 - ▶ Expected application events rate is low
 - Regardless of connection speed

Thwarting Masquerading - What

- Identify attackers hiding their true source
- Hiding places
 - ▶ Network relays (SOCKS Proxy)
 - ▶ Anonymous proxies
 - ▶ TOR network (Onion routers)

Thwarting Masquerading – How (1)

- Blacklist known IP masquerading addresses
 - ▶ TOR servers
 - ▶ Anonymous proxy computers

Thwarting Masquerading – How (2)

- Detect discrepancies between information implied by IP address and the actual request
 - ▶ “Accept Language”
 - Value is local (en-us) but address is foreign
 - Value is foreign but address is local
 - ▶ Response time
 - In accordance to what is implied by location
 - ▶ Abnormal path
 - Analyze BlueCoat headers

Thwarting Masquerading – Why

Reputation – What (1)

■ Listings of IP addresses with bad reputation

- ▶ Compromised servers
- ▶ Botnet C&C servers
- ▶ Infected servers
- ▶ Infected computers
- ▶ Active spam sources
- ▶ Crawlers
- ▶ ...

Reputation – What (2)

- Listings of IP addresses with impeccable reputation
 - ▶ Legitimate search engine bots
 - ▶ Aggregators (Akamai, Limelight)

Reputation – How

- “Real-time” feeds for blacklists
 - ▶ Information should be updated and queried with high frequency (at least hourly)
 - ▶ Aging mechanisms must be applied
- Honeypots
- Community effort
- Dynamic Allocation
 - ▶ Usually static for days

Reputation – Why (1)

- Form spam / Comment spam
 - ▶ Identify potentially vulnerable resources
 - ▶ Block access by known active spamming sources
- Business Logic Attacks
 - ▶ Reduced functionality for known infected sources
 - ▶ Require extended authentication

Reputation – Why (2)

■ Automation

- ▶ Challenge for anti-automation

■ Block active attack sources

- ▶ 0-days can be blocked based on who is actually using them.

IP Intelligence Tools

Geo Location Tools (1)

■ Two major form factors

▶ Online service

- Forensic analysis
- Non-stream applications (email)
- e.g. Quova

▶ On-premise database with API

- Online security decisions
- e.g. Maxmind

Geo Location Tools (2)

- Different levels of granularity
 - ▶ Connection and allocation
 - ▶ Proxy detection

Reputation Data (1)

■ Multiple providers

- ▶ Different data sets and information
- ▶ Specialize towards specific type of malicious activity
 - Spam
 - Botnet
 - ...

■ Data provided in various forms

- ▶ Web Service
- ▶ Incoming feed
- ▶ On premise database/ appliance shielded by an API

Reputation Data (2)

■ Various data attributes

- ▶ Raw data – use with discretion
- ▶ Processed data
- ▶ Gradual score

■ Data includes various indicators

- ▶ A measurement for intensity of malicious activity
- ▶ Activity duration information (last seen, first seen, etc.)

Reputation Data (3)

■ Non-commercial sources

- ▶ Dshield (www.dshield.org)
- ▶ ShadowServer (www.shadowserver.org)

Reputation Data (3)

■ Commercial providers

- ▶ Verisign (iDefenceLabs)
- ▶ RSA
- ▶ McAfee (TrustedSource)
- ▶ CommTouch
- ▶ ThreatMetrix
- ▶ Cyveillance
- ▶ Unspam

Putting It All Together

IP Intelligence – Step #1

- Incorporate IP Intelligence into your security process
 - ▶ Geo Location as a forensic tool
 - ▶ Incorporate Geo Location into many frameworks
 - Supported by log aggregators
 - SIEMs can be customized

IP Intelligence – Step #2

- Integrate with IP reputation services at different points
 - ▶ Some vendors (FW, WAF) offer it
 - ▶ Some reputation vendors offer their own independent solution
 - ▶ Most email protection solutions already have their integration out of the box

IP Intelligence – Step #3

■ Evaluate which vendor provides the most suitable solution for you

- ▶ Form factor
 - High speed streaming
 - Manual forensic process
- ▶ Focus of data
 - Spam
 - Web attacks
 - Bot infection
- ▶ Data attributes
 - Raw data
 - Processed, scored feed

IP Intelligence – Summary (1)

- Changes in threatscape make the use of IP Intelligence valuable for detecting and mitigating attacks.
 - ▶ Quickly identify known bad and keep your focus on complex issues
 - ▶ Mitigate 0-day attacks before they are well-analyzed and have specific protection
 - ▶ Fight online fraud with tools that help evaluate transactions and user behavior.

IP Intelligence – Summary (2)

- Commercial tools of various shapes and different purposes are available
 - ▶ Some are forensic analysis-oriented. Others can integrate with online security devices
 - ▶ Some vendors provide packaged solutions

Q & A
